

CLAIMS

I claim:

1. A cabbage cutter, designed specifically to cut cabbage, comprising a hollow, metal cylindrical shaped body with a closed top and an open bottom rim that has been filed or rubbed down to a smooth, thin, sharp cutting and chopping means that can be resharpened if it should become dulled from extensive use. The cylindrical shaped body of the device measures two and three-fourths inches in diameter and four inches in length, and is constructed of a hard, strong metal with high tensile strength, preferably stainless steel, which makes the device superior in strength and durability, and resistant to corrosion and rusting, and the cylindrical wall and closed top have imperforate smooth interior and exterior surfaces. The closed top of the cylindrical shaped body is covered with a permanently affixed cap, preferably suitable molded plastic, that extends three-fourths of an inch over onto the cylindrical shaped wall of the device that serves as a hand grip so that the user will be able to maintain a good grip on the device to use it efficiently and effectively at all times. The permanently affixed cap (hand grip) also provides cushion and support for the hand of the user. The device has a removable protective cover, contiguous with the cutting and

chopping portion of the hollow cylindrical shaped body, that fits over the cutting and chopping means to serve as a protective shield from injury, and also protects it from becoming damaged, when the device is not in use or stored.

a' The cabbage cutter device is designed and constructed for superior strength and durability and will do an excellent job cutting through the thick stalks and tightly overlapping leaves of cabbage.
